

Investment opportunities

Most prospective direction of work, which is supported by prophecy of one of the founders of bahai religion, is development of technology for elements transmutation, which might serve as basement for development of new energy sources.

Scientific development of such technology has to be based on divine philosophy, as it is written in the prophecy. Common use of this technology will be among four signs of maturity of humankind, which has to come to its age. The prophecy was written in mid of 19th century. We won't cite it in the whole, but will concentrate ourselves on possible scientific and technological developments, which are in its frame.

What is related to most obvious application of transmutation is its current application in fission and fusion nuclear reactors, where some elements form other with excess energy. Disadvantage of such applications is in impossibility for ones' common use in every house or car. Modern nuclear reactors are not environmentally friendly and not small in size. Ones' use is environmentally harmful.

What could be considered as way out from these drawbacks?

We have such a way not only in general philosophical sense (which might be designated as based on divine philosophy) but also on modern technical, technological and scientific achievements, which can be referenced.

The first such achievement, developed in close collaboration between CMEF and scientific media, is in approach to gasification technology considered in a frame of general philosophical approach to transmutation.

Its essence might be expressed in general definition of transmutation as transformation of internal bonds in some thing. The transformation has to be caused by special quality of interference onto dynamical formation of the thing with its internal bonds, which have several logical levels of origin and structuring in two-sided way of energy to the final level supposed to be nearest to Creator of everything.

As this way is two-sided, reformation of the bonds forming some thing on some logical level of structuring creates possibility for disturbance of energy motion in this two-sided way. The disturbance has to be caught to provide us with energy coming from reformation of the bonds, or transmutation.

Most viable example of reformation of the bonds on molecular level of structuring is pyrolysis and gasification of different organic and inorganic wastes. This technology is pretty old and well established. There are, however, some new technical ways to make breakage of the bonds in the wastes on the base of general approach expressed above. Their distinction is in taking to account of existence of this two-sided way to origin of everything and in use of natural possibilities for interference into motion of energy on this way. Needed for practical purposes quality of this interference may be achieved only with conscious consideration to what and whom this way is.

Picture of one of the first gasification devices built at CMEF with an aim to research these possibilities for breakage of chemical bonds is below.

We invite readers to invest into this technology being developed at CMEF.

Another technology, which attracts reasonable interest in the frame of shortly described above “divine” philosophy is aimed for creation of better treatment of nuclear wastes.

From the philosophical point of view, molecular bonds and bonds inside atom or nucleus are formed on different logical levels of structuring. These levels also are situated on different levels of scales. What is not different is the way of action onto the bonds, which has to be developed with taking to account the idea of the two-sided way of motion of energy, which forms structures on different levels and scales.

One of such ways of action onto the substances in nuclear wastes is to be developed using specially designed cavitation devices.

Experiments with cavitation devices decreasing level of radioactive pollution were done in Russia. The devices showed transmutation inside the cavitators resulting in change of radioactive substances. Appeared new substances in the devices were not radioactive. Scientifically sound explanations of such phenomena are absent. To build actually new science able to explain these phenomena is very difficult task. It might be possible if the cavitators will be designed with having in mind the mentioned above natural possibilities for interference into the two-sided way of interaction between the things and Creator.

Research of these possibilities with an aim to improve technology for processing of nuclear waste on the base of such a “divine” philosophy requires much more investments in comparison with research of transmutation on molecular level.

We invite reader to help as much as possible to both of these directions.
